

Tail transfer system

A correct trailing end system is essential for high efficiency of the continuous machine.

- systems with wires;
- systems with air;
- combined systems.

Pulper L/M density

- complete pulpers or rotors for low and medium density;
- pulpers and rotors for trim pits and under machines.

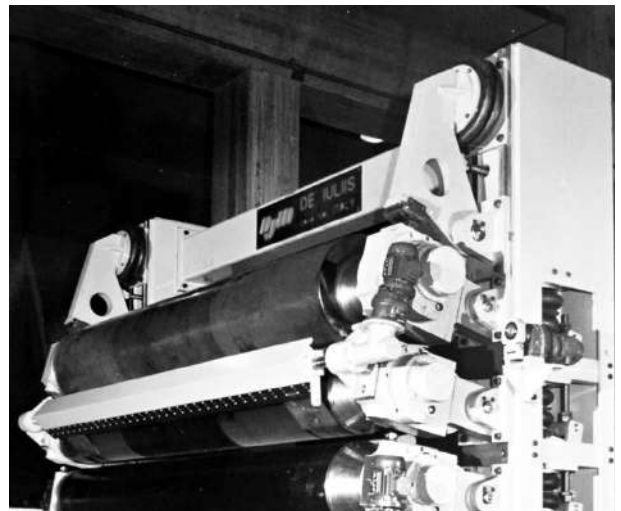

Light regulation between the perforated plate and the impeller is effected without having to dismount the impeller, with consequent remarkable reduction of time.

Transfert roll systems

The system of automatic conveyance of the reel from the pope to the rewinding machine increases the efficiency of the production line thanks to:

- handling of the reels in maximum safety;
- reduced times for winding the reel and recovering the empty pole;
- reduction of rejects.

Calender

Our calenders and soft calenders assure maximum homogeneity in thickness and smoothness.

The cylinders installed on our calenders have different technical features in line with the types of paper / cardboard produced and the goals to be achieved.

We can supply:

- single nip
- multi-nip calenders
